

ABSTRACT OF THE DISCLOSURE

A contamination-control mat assembly includes a stacked array of pressure-sensitive adhesive coated plastic sheets disposed upon a base member which is to be affixed upon an underlying floor support structure by an adhesive layer disposed upon an undersurface portion of the base member. A release sheet is removably disposed upon the adhesive layer so as to cover and protect the same until it is desired to remove the release sheet in order to expose the adhesive layer when the contamination-control mat assembly is to be affixed to the underlying floor support structure. In order to facilitate the removal of the release sheet from the adhesive layer disposed upon the undersurface portion of the base member, a pull-tab is adhesively bonded to an external surface portion of the release sheet so as not to be disposed in contact with the adhesive layer whereby removal of the release sheet from the adhesive layer is unimpeded and readily facilitated as a result of operator personnel grasping and manually manipulating the pull-tab.
